

Model instructions

PAPER MODEL PLANS

Models are best done with card stock colored paper. You are welcome to print, copy and enlarge the paper model plans for your own personal (non commercial) use as a tool for dome study and observation.

Procedure:

1. Print the pattern pages once or print quantity noted
2. Cut out the pattern pieces along the perimeter lines
3. Make creases on the interior lines by pushing down on a straight edge.
Suggestion: use a counter top with a light underneath to help see the lines. Bend the edges down enough to make a good edge crease visible.
4. Orientation for taping together sections is shown on page 1 of each pdf.
5. Match up adjacent lines and apply tape to the inside; lines should be on outside. If you are building a dome, mark identification letters (struts) and numbers (connector hubs) from the dome instructions to help locate parts during dome assembly.

Julie' Weldon Ph.D

Build a geodesic dome- use it for a greenhouse, animal shelter, cabin, workshop, studio, or anything that needs a strong cover.
